Outcomes Assessment for Module 1

Formative: In the midst of learning, ask students to explain their current understanding and provide corrective feedback as necessary for objectives A, B, and C.
Summative/Deliverables
Students will create two labeled maps of the natural water cycle and explain how water transports through each. The first map will be a simple natural water cycle map (obj D and E) and the second map will be a global travel map that includes the natural water cycle as the travel itinerary (obj F).

- To assess, simple rubrics should be created for each map that list all required elements for the specific objectives (see How Learning Occurs for basic explanation of rubric building; see Resources for sample for this module).

While the above objectives and deliverables are suggested, students can produce many other deliverables which can be used to assess their new knowledge and skills including infographics, informational pamphlets, presentations, research papers, travel folios, etc.

Sample Rubric for Module 1:

Sample: Simple rubric for objectives D/E (simple natural water cycle map) and/or objective F (global travel water cycle map)

Criteria	Points
1. Evaporation: In all instances it is correctly placed and labeled on the map	2
2. Transpiration: In all instances it is correctly placed and labeled on the map	2
3. Condensation: In all instances it is correctly placed and labeled on the map	2
4. Precipitation: In all instances it is correctly placed and labeled on the map	2
5. Run-off: In all instances it is correctly placed and labeled on the map	2
6. Infiltration: In all instances it is correctly placed and labeled on the map	2

7. Percolation: In all instances it is correctly placed and labeled on the map	2
8. Student correctly explains the transport of water: Obj E: through all 7 transport processes on the map Obj F: through the 3 transport processes specifically asked about	14
9. Student correctly identifies the phase of water: Obj E: found in all 7 transport processes on the map Obj F: found in the 3 transport processes specifically asked about	7
10. Global travel map traces the water cycle from local drinking water source (in North America), through three other continents, and back to local drinking water source	25

NOTE:

- Use Criteria 1-7 for objective D, Criteria 8-9 for objective E, and all Criteria for objective F
- *Point values should be set at the discretion of the teacher. Point values provided to show the weight of criteria in relation to each other – things that are more difficult should hold more weight/value*
- On rubrics for both obj E and obj F, suggest maintaining similar weight/point values on Criteria 8 and 9 since it is harder to explain the individual elements of a cycle out of context than explain the elements of the whole cycle in context
