Outcomes Assessment Module 2:

Formative: In the midst of learning, ask students to explain their current understanding and provide corrective feedback as necessary for objectives A-F and H.

Summative/Deliverables:

Students will create a labeled map of their local human water cycle and explain how water transports through it from source to effluent. (obj. G)

To assess, a simple rubric should be created for the map that lists all required elements for the specific objective (see How Learning Occurs for basic explanation of rubric building; see Module 1 for sample map rubric).

Students will solve a problem scenario for the module and report on their findings/results (e.g., written report, research paper, digital presentation, oral presentation in class or to a local interest group, video presentation, infographic poster, informational pamphlet, portfolio). (obj. I)

To assess, a simple rubric should be created for the report that lists all required elements for the specific objective (see How Learning Occurs for basic explanation of rubric building; see Resources for sample rubric for this assignment).

While the above objectives and deliverables are suggested, students can produce many other deliverables which can be used to assess their new knowledge and skills.
